1 Introduction

1.1 About Intel® Memory and Storage Tool

The Intel Memory and Storage Tool (Intel® MAS) is available in two interface types; as a command line interface (CLI) tool and a graphical user interface (GUI) tool. This document focuses on usage of the GUI interface version. The Intel® MAS tool is drive management software that enables you to view the following information for Intel® SSDs:

- [Drive Health](#)
- [Estimated Life Remaining](#)
- [SMART attributes](#) (also available for hard disk drives and non-Intel® SSDs)
- [Drive Details](#) (also available for hard disk drives and non-Intel SSDs)
- [Optimize performance of an Intel SSD](#) using Trim functionality (a command that allows an operating system to inform an SSD which blocks of data are no longer considered in use and can be deleted)
- [Run Quick](#) and [Full diagnostic scans](#) to test the read and write functionality of an Intel SSD
- [Check and tune your system settings](#) for optimal Intel SSD performance, power efficiency, and endurance
- [View your system information](#) and hardware configuration, such as central processing unit (CPU), chipset, controller name and driver versions
- [Update the firmware](#) on an Intel SSD
- [Run Secure Erase](#) on a secondary Intel SSD

1.2 Using the Home Screen

The home screen shows an icon (representing the assigned device letter ID and capacity) for each Intel® SSD. Under the settings icon  on the Advanced tab, select 'Show Non-Intel Drives' to display any other drives (hard disk drives and non-Intel SSDs) installed in your system.

Click the icon of the drive you want to manage.

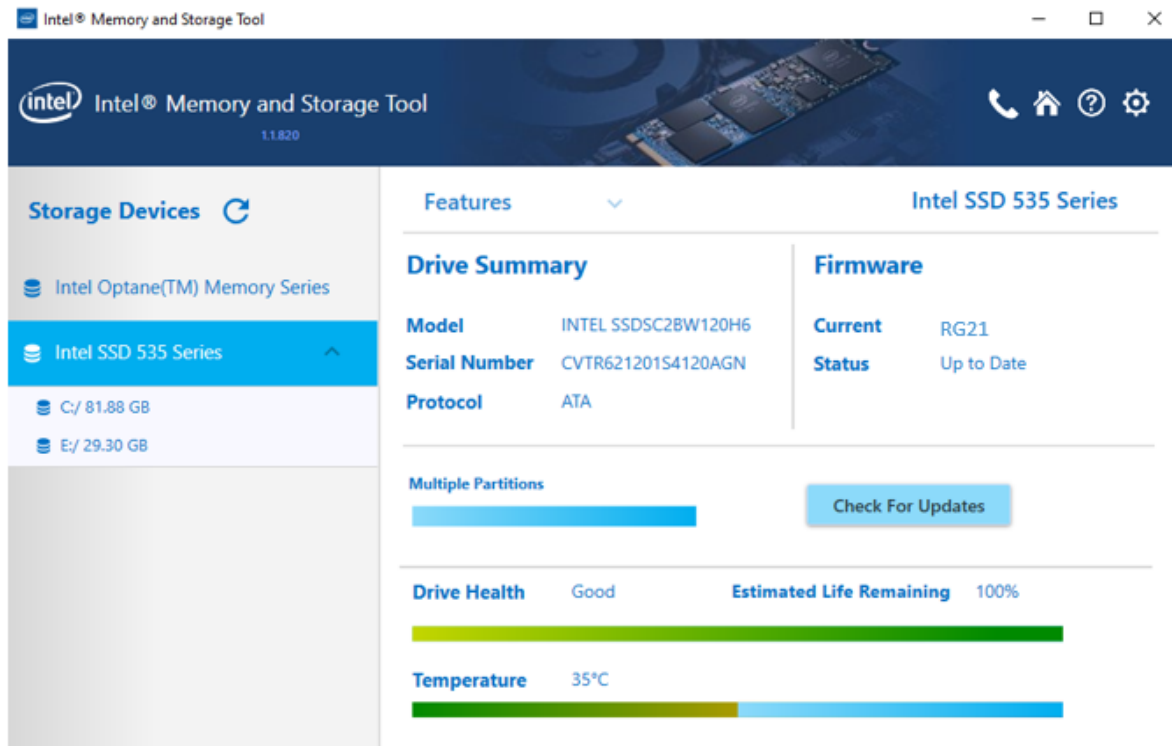

Note: If a drive contains a partition or is installed as a cache device, it appears as a separate device, with its own icon, on the home screen. See [Identifying a Drive](#) for more details.

Drive Summary information of the selected device is displayed; the displayed Information varies depending on the selected device type.

- [Model](#)
- [Firmware Version](#)
- [Serial Number](#)
- [Drive Capacity](#)
- [Drive Health](#)
- [Estimated Life Remaining](#)

Following is a screenshot of the home screen with a device selected:

To run a task on the selected drive, select an option from the “Features” drop down menu on the main screen. (Available tasks vary depending on the type of device selected.)

- [Intel SSD Optimizer](#)
- [Drive Details](#)
- [Diagnostic Scan](#)
- [Secure Erase](#)
- [Firmware Update](#)
- [LED Color](#)
- [Performance Booster](#)

Click the **Refresh**  button to [rescan](#) for drives and refresh all information displayed in the Intel MAS Tool.

If updates or other actions are recommended on the selected Intel SSD, the following icon appears next to an option on the home screen:

Tip: Move the mouse pointer over this icon in the Intel MAS tool to view the recommended action.

Related Sections

[Scanning for Drives](#)

[Identifying a Drive](#)

1.3 Scanning for Drives

Upon startup, the Intel MAS tool scans for all available devices installed in the system including Intel SSDs, non-Intel SSDs, and hard disk drives (HDDs). Icons for all located drives will appear on the home screen.

If your system contains multiple drives, use the arrows to the left and right of the drive icons to scroll through and select a drive.

Select the **Refresh**  button on the home screen to rescan the system for devices, or exit Intel MAS tool by clicking the X in the upper-right corner and start the program again.

If an installed device does not appear on the home screen, see [Troubleshooting Drives](#).

Related Sections

[Identifying a Drive](#)

[Viewing Drive Health](#)

[Viewing Estimated Drive Life Remaining](#)

1.4 Identifying a Drive

An icon for each drive, labeled with the drive product family (or model number if product family is unknown), appears in a navigation bar on the left side of the UI. If your system contains multiple drives, simply click on desired drive to display the drive summary screen for the selected drive.

Information displayed for a drive may include:

- Assigned drive letter (Drive partitions, and drives installed as cache devices, appear as separate drives and may contain assigned drive letters)
- Usable capacity

Note: The total usable capacity of an Intel SSD may be less than the total physical capacity because a small portion of the capacity is used for NAND flash management and maintenance purposes.

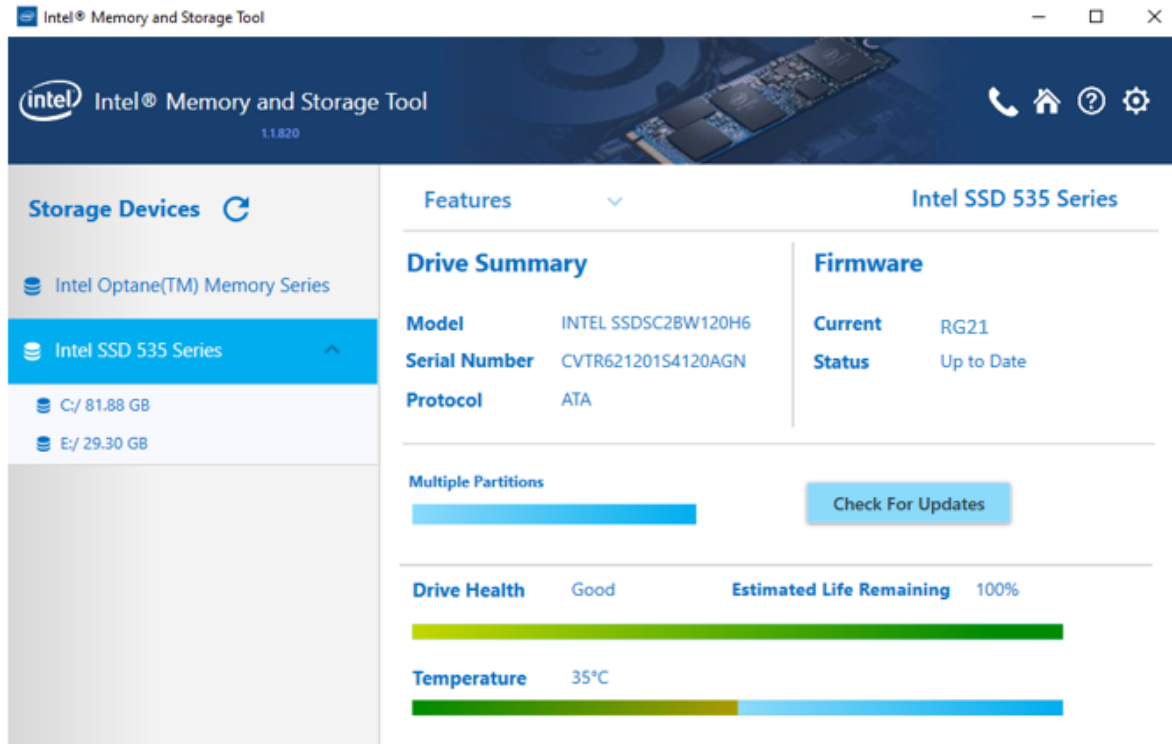

Move the mouse pointer over a drive icon or click on the drive for more information.

If an installed drive does not appear on the home screen, see [Troubleshooting - Drives](#).

Drives containing partitions

If a drive contains multiple partitions, each partition appears as a separate drive in the navigation bar on the left side of the screen. To select a partition, a user can use the drop down to the right of the drive product name. An example is shown below:

Drives installed as cache devices using Intel® Rapid Storage Technology (Intel® RST)

If a drive is installed as a cache device using Intel® RST, the drive appears as a separate drive on the home screen without an assigned drive letter. Intel MAS tool identifies this type of drive as a RAID volume member (a specific drive in a RAID volume).

Drives part of a RAID array using Intel® RST

If a drive is installed as part of a RAID array using Intel® RST, the drive appears as a separate drive on the home screen. Move the mouse over the drive to identify if it is the RAID volume (all drives in the RAID array) or a RAID volume member (a specific drive in a RAID volume).

Note: RAID volumes and RAID volume members have limited functionality in the Intel MAS Tool.

Drives part of dynamic partitions

If a drive is part of a dynamic partition, the drive appears as a separate drive on the home screen.

Note: You can run Intel SSD Optimizer on *simple dynamic partitions* only. See your system documentation for identifying partition types.

Related Section

[Identifying Security State of an Intel SSD](#)

2 Viewing Basic Drive Information

2.1 Model Information

Model information, such as device type, bus architecture, controller mode, form factor, and capacity is available for each drive on the home screen.

The model number, firmware version and the serial number are always displayed for the selected drive in the Drive Summary section.

More detailed information is available by moving and holding the mouse pointer over a drive icon. For Intel SSDs, this information includes a reference to the NAND lithography. For example:

- If the number includes **G1**, the SSD is based on 50nm NAND lithography.
Note: *The Intel SSD Optimizer does not run on these SSDs. See [Intel SSD Optimizer Requirements](#) for more information.*
- If the number includes **G2** or **A2**, the SSD is based on 34nm NAND.
- If the number includes **G3**, the SSD is based on 25nm NAND.
- If the number includes **A3**, the SSD is based on 20nm NAND.

2.2 Firmware Version

On the home screen, the Drive Summary section shows the version of firmware currently installed on the selected Intel SSD.

If the selected Intel SSD contains an older version of firmware than what is included with this version of the Intel MAS Tool, the following icon appears next to the Firmware Update option:

To check if a newer firmware version is available for your Intel SSD, see [Checking for Firmware Updates](#).

Note: If you purchased your Intel SSD from an OEM, your firmware version may have a different naming convention. The Intel MAS tool does not support updating firmware on OEM drives, contact your local OEM representative or support site for latest firmware revisions.

2.3 Serial Number

On the home screen, the Drive Summary section shows the Serial Number of the selected drive. This information can be useful when contacting technical support.

2.4 Drive Health

On the home screen, the the drive health information of the selected Intel SSD as measured by supported [SMART](#) attributes is displayed.

- Good (green) - All SMART attributes are above their threshold levels.
- Warning (orange-red) - One or more SMART attributes has moved beyond the threshold level and reached the final value. Intel recommends you back up all data and consider replacing the SSD.
- Critical (red) – A SMART critical warning has been triggered or the drive has encountered a critical error related to drive degradation. Intel recommends you back up all data and consider replacing the SSD.

Related Section

[Viewing Estimated Life Remaining](#)

2.5 Estimated Life Remaining

On the home screen, the Estimated Life Remaining of the selected Intel SSD is displayed.

Endurance calculations are estimated and may vary. The estimation shown is based on the applied workload and is not accurate if the workload changes. Estimates are based on your usage to date and will not extend or reduce the SSD warranty period.

Estimated Life Remaining is reported for Intel SSDs only with SMART enabled or with a SMART health log available

Related Section

[Viewing Drive Health](#)

2.6 Drive Capacity

On the home screen, the capacity bar graph reports the amount of used and free space available on the selected Intel SSD.

The capacity bar graph appears for Intel SSDs with valid partitions only. The bar graph is empty for SSDs without a valid partition or for SSDs installed as a cache.

Note: The total usable capacity may be less than the total physical capacity because a small portion of the capacity is used for NAND flash management and maintenance purposes.

3 Obtaining Drive, SMART, and System Information

Under the Features drop down, the Drive Details section can be accessed to view

- Additional Drive Details
- SMART Details
- Export functionality to *.csv

3.1 Drive Details

The Drive Details screen displays standard identification data for the selected drive. The information displayed is generated by an [ATA IDENTIFY DEVICE](#) or [NVMe IDENTIFY](#) command, depending on the attached drive.

Scroll down to view all values on the screen. Details shown for each value include:

- **Word:** Identifies the word(s) assigned to a specific value.
- **Description:** Provides the name and bit information (if needed) for each value.
- **Hex value:** Reports the hexadecimal value for each piece of drive information.

The following are commonly referenced values. For complete descriptions of all values, see the [ATA specifications](#).

- **Serial Number** (Word 10-19): Identifies production information about the selected drive.
- **Firmware Version** (Word 23-26): Version of firmware installed on the selected drive.
- **Model Number** (Word 27-45): Model of the selected drive.

For Intel SSDs, the model number contains reference to the [NAND lithography](#).

- **Security Status** (Word 128): Security state of the selected drive.
 - Bit 0 indicates the Security Mode feature set supported. If set to one, security is supported.
 - Bit 1 indicates security enabled. If set to one, the security is enabled.
 - Bit 2 indicates security locked. If set to one, the security is locked.
 - Bit 3 indicates security frozen. If set to one, the security is frozen.

See the ATA-7 Specification or the NVMe 1.3 Specification for more information.

Note: To reissue the ATA IDENTIFY DEVICE or NVMe IDENTIFY command and display updated information for the selected drive, click the **refresh**  icon.

[Reference Documents](#)

3.2 Exporting Drive Details

Under the **Drive** Details section, click **Export** to save [SMART attributes](#), [drive details](#), and [system information](#) for the selected drive to a .csv (comma-separated values) file, which can be opened in a program such as Microsoft Excel.

Related Section

[Viewing Drive Details](#)

3.3 SMART Attributes

The SMART Details screen shows Self-Monitoring, Analysis, and Reporting Technology (SMART) attributes and/or SMART Health Info attributes on the selected drive. Recommended actions (if any) appear next to each attribute.

Each drive operates under a predefined set of SMART attributes and corresponding threshold values, of which the drive should not pass during normal operation¹. Each attribute has a *raw* value (defined by the manufacturer) and a *normalized* value¹. See the [ATA specifications](#) and [NVMe specifications](#) for a complete description of each SMART attribute.

Scroll down to view the SMART attributes supported by the selected ATA or NVMe drive.

Details shown for each SMART attribute include:

- **ID:** The hexadecimal name of the SMART attribute.
- **Description:** The name of the SMART attribute.
- **Raw:** The raw value assigned to the SMART attribute by the drive manufacturer.
- **Normalized¹:** The value of an attribute adjusted to a scale spanning typical increments of 100 to 1, or 200 to 1.
- **Threshold¹:** The lowest acceptable normalized value for the drive.
- **Action:** Identifies whether the system can use the drive for processing.

Descriptions of some SMART attributes are shown in the following table. These attributes vary depending on the Intel SSD or other drive selected. Your SSD or drive may not support some of these attributes. For more details on each attribute, see the [ATA specifications](#) and [NVMe specifications](#).

ID	Attribute and Description (SATA)
03	Spin Up Time For Intel SSDs, reports a fixed value of zero (0). The average time it takes the spindle to spin up. (Since an SSD has no moving parts, this attribute reports a fixed Raw value of zero (0) and a fixed Normalized value of 100.)
04	Start/Stop Count For Intel SSDs, reports a fixed value of zero (0). This type of event is not an issue for SSDs. However, hard disk drives can experience only a finite number of these events, and therefore, must be tracked.
05	Re-allocated Sector Count The raw value shows the number of retired blocks since leaving the factory (grown defect count).

ID	Attribute and Description (SATA)
09	<p>Power-On Hours Count The raw value reports the cumulative number of power-on hours over the life of the device.</p> <p>Note: The On/Off status of the Device Initiated Power Management (DIPM) feature affects the number of hours reported.</p> <ul style="list-style-type: none"> • If DIPM is turned on, the recorded value does not include the time that the device is in a <i>slumber</i> state. • If DIPM is turned off, the recorded value should match the clock time, as all three device states are counted: <i>active</i>, <i>idle</i>, and <i>slumber</i>.
0C	<p>Power Cycle Count The raw value reports the cumulative number of power-cycle events (power on/off cycles) over the life of the device.</p>
AA	<p>Available Reserved Space Reports the number of reserve blocks remaining. The normalized value begins at 100 (64h), which corresponds to 100 percent availability of the reserved space. The threshold value for this attribute is 10 percent availability.</p>
AB	<p>Program Fail Count The raw value shows total count of program fails. The normalized value, beginning at 100, shows the percent remaining of allowable program fails.</p>
AC	<p>Erase Fail Count The raw value shows total count of erase fail. The normalized value, beginning at 100, shows the percent remaining of allowable erase fails.</p>
AE	<p>Unexpected Power Loss Reports number of unclean shutdowns, cumulative over the life of the SSD. An “unclean shutdown” is the removal of power without STANDBY IMMEDIATE as the last command (regardless of PLI activity using capacitor power). Also known as “Power-off Retract Count” per magnetic-drive terminology.</p>
B8	<p>End-to-End Error Detection Count Reports number of errors encountered during Logical Block Address (LBA) tag checks within the SSD data path. The normalized value begins at 100 and decrements by 1 for each LBA tag mismatch detected. The threshold value is 90.</p>
BB	<p>Uncorrectable Error Count The raw value shows the count of errors that could not be recovered using Error Correction Code (ECC).</p>
BE	<p>Temperature - Airflow (Case) Reports the SSD case temperature in degree Celsius. The raw value is as follows:</p> <ul style="list-style-type: none"> • Byte 0 = Current case temperature (° C) • Byte 2 = Recent minimum case temperature (° C) • Byte 3 = Recent maximum case temperature (° C) <p>The normalized value is 100. Case temperature is calculated based on an offset from internal temperature sensor.</p>
C0	<p>Unsafe Shutdown Count (Power-off Retract Count) The raw value reports the cumulative number of unsafe (unclean) shutdown events over the life of the device. An unsafe shutdown occurs whenever the device is powered off without STANDBY IMMEDIATE being the last command.</p>

ID	Attribute and Description (SATA)
C2	Temperature - Device Internal Reports internal temperature of the SSD. Temperature reading is the value direct from the internal sensor. The raw value is the current temperature. The normalized value is the results equation min (150-current temp, 100).
C7	CRC Error Count The total number of encountered SATA interface Cyclic Redundancy Check (CRC) errors.
E1	Host Writes The raw value reports the total number of sectors written by the host system. The raw value increases by 1 for every 65,536 sectors written by the host.
E2	Timed Workload, Media Wear Measures the wear seen by the SSD (since reset of the Timed Workload Timer, attribute E4), as a percentage of the maximum rated cycles.
E3	Timed Workload, Host Read/Write Ratio The percentage of I/O operations that are read operations (since reset of the Timed Workload Timer, attribute E4).
E4	Timed Workload Timer Measures the elapsed time (number of minutes) since starting this workload timer.
E8	Available Reserved Space Reports the number of reserve blocks remaining. The normalized value begins at 100 (64h), which corresponds to 100 percent availability of the reserved space. The threshold value for this attribute is 10 percent availability.
E9	Media Wearout Indicator Reports the number of cycles the NAND media has undergone. The normalized value declines linearly from 100 to 1 as the average erase cycle count increases from 0 to the maximum rated cycles. Once the normalized value reaches 1, the number will not decrease, although it is likely that significant additional wear can be put on the device.
F1	Total LBAs Written Counts sectors written by the host.
F2	Total LBAs Read Counts sectors read by the host.

Scroll down to view the SMART Health Info attributes supported by the selected NVMe drive.

Details shown for each SMART Health Info attribute include:

- **ID:** The byte offset value of the SMART Health Info.
- **Description:** The name of the SMART Health Info.
- **Raw:** The raw value assigned to the SMART Health Info by the drive manufacturer.
- **Threshold¹:** (If defined) The lowest acceptable normalized value for the drive.
- **Action:** Identifies whether the system can use the drive for processing.

Descriptions of some SMART Health Info attributes are shown in the following table. These attributes vary depending on the Intel SSD or other drive selected. Your SSD or drive may not support some of these attributes. For more details on each attribute, see the NVMe specification.

ID	Attribute and Description (NVMe)
1	Temperature Reports overall Device current temperature in Kelvin.
3	Available Spare Contains a normalized percentage (0 to 100%) of the remaining spare capacity available. Starts from 100 and decrements.
4	Available Spare Threshold Threshold is set to 10%.
5	Percentage Used Estimate (Value allowed to exceed 100%) A value of 100 indicates that the estimated endurance of the device has been consumed, but may not indicate a device failure. The value is allowed to exceed 100. Percentages greater than 254 shall be represented as 255. This value shall be updated once per power-on hour (when the controller is not in a sleep state).
32	Data Units Read (in LBAs) Contains the number of 512 byte data units the host has read from the controller; this value does not include metadata. This value is reported in thousands (i.e., a value of 1 corresponds to 1000 units of 512 bytes read) and is rounded up. When the LBA size is a value other than 512 bytes, the controller shall convert the amount of data read to 512 byte units.
48	Data Units Write (in LBAs) Contains the number of 512 byte data units the host has written to the controller; this value does not include metadata. This value is reported in thousands (i.e., a value of 1 corresponds to 1000 units of 512 bytes written) and is rounded up. When the LBA size is a value other than 512 bytes, the controller shall convert the amount of data written to 512 byte units. For the NVM command set, logical blocks written as part of Write operations shall be included in this value. Write Uncorrectable commands shall not impact this value.
64	Host Read Commands Contains the number of read commands issued to the controller.
80	Host Write Commands Contains the number of write commands issued to the controller.
96	Controller Busy Time (in minutes) Contains the amount of time the controller is busy with I/O commands. The controller is busy when there is a command outstanding to an I/O Queue (specifically, a command was issued by way of an I/O Submission Queue Tail doorbell write and the corresponding completion queue entry has not been posted yet to the associated I/O Completion Queue). This value is reported in minutes.
112	Power Cycles Contains the number of power cycles
128	Power On Hours Contains the number of power-on hours. This does not include time that the controller was powered and in a low power state condition.
144	Unsafe shutdowns Contains the number of unsafe shutdowns. This count is incremented when a shutdown notification (CC.SHN) is not received prior to loss of power.
160	Media Errors Contains the number of occurrences where the controller detected an unrecovered data integrity error. Errors such as uncorrectable ECC, CRC checksum failure, or LBA tag mismatch are included in this field.

ID	Attribute and Description (NVMe)
176	Number of Error Information Log Entries Contains the number of Error Information log entries over the life of the controller.
192	Warning Composite Temperature Time Contains the amount of time in minutes that the controller is operational and the Composite Temperature is greater than or equal to the Warning Composite Temperature Threshold (WCTEMP) field and less than the Critical Composite Temperature Threshold (CCTEMP) field in the Identify Controller data structure.
196	Critical Composite Temperature Time Contains the amount of time in minutes that the controller is operational and the Composite Temperature is greater the Critical Composite Temperature Threshold (CCTEMP) field in the Identify Controller data structure.
0	Critical Warning These bits if set, flag various warning sources. <ul style="list-style-type: none">• Bit 0: Available Spare is below Threshold• Bit 1: Temperature has exceeded Threshold• Bit 2: Reliability is degraded due to excessive media or internal errors• Bit 3: Media is placed in Read- Only Mode• Bit 4: Volatile Memory Backup System has failed (e.g., enhanced power loss capacitor test failure)• Bits 5-7: Reserved Any of the critical warning can be tied to asynchronous event notification.

Note: To reissue the ATA IDENTIFY DEVICE command or the NVMe IDENTIFY command and refresh the SMART information for the selected drive, click the **refresh**  icon.

Note: 1. Threshold and Normalized values not applicable to NVMe drives unless defined in spec.

4 Optimizing your Intel SSD

4.1 About the Intel® SSD Optimizer

The Intel SSD Optimizer helps an Intel SSD retain its out-of-box performance by removing deleted data files from NAND flash management blocks on the SSD using trim functionality (a command that allows an operating system to identify and tell an SSD which blocks of data are no longer considered in use, and can be deleted).

For example, when you delete a file on your system, the operating system marks the file for deletion but does not physically erase the file. Because an SSD does not know which files are deleted, the SSD continues to think all files contain valid data. This situation causes the SSD to continue managing deleted files in addition to valid data in the SSD.

By running the Intel SSD Optimizer, the tool identifies which files you have deleted and communicates that information to the SSD. This notification allows the SSD to clean up internal management space, thus eliminating the need to manage the deleted files.

You can [schedule](#) the Intel SSD Optimizer to run automatically on a weekly, daily, or monthly basis or you can [manually run](#) it at any time.

Note: On supported Intel® SSD's there may be additional options to boost performance available in the Intel® MAS Tool under the Performance Booster feature. Please see Section 10 for more information.

Related Sections

[Intel SSD Optimizer Requirements](#)

[Scheduling the Intel SSD Optimizer](#)

[Running the Intel SSD Optimizer Manually](#)

4.2 Intel® SSD Optimizer Requirements

The Intel SSD Optimizer runs on Intel SSDs only.

Before running the Intel SSD Optimizer, make sure the Intel SSD has the latest firmware installed. See [Checking for Firmware Updates](#).

Note the following before running or scheduling the Intel SSD Optimizer:

- Trim feature intentionally disabled for Intel® Optane™ Memory - TRIM or Optimize is not necessary because of the Intel® Optane™ Memory Module architecture.
- Do not run the Intel SSD Optimizer when a backup is in progress
- Do not run the Intel SSD Optimizer if the Intel SSDs are in a RAID configuration ²
- The Intel SSD Optimizer does not support Windows 8, Windows 8.1, Windows 10 or Windows Server 2012 Storage Spaces, nor any individual drive that is a member of a Storage Space
- The Intel NVMe driver is required for Intel PCIe NVMe based drives

Note: Not all drives are supported by the Intel NVMe driver, check the [download page](#) for more information on support

- Make sure Intel SSD Optimizer sessions are scheduled to run when the computer is on. The Intel SSD Optimizer does not wake up or turn on the computer to run a scheduled session
- The drive must have a partition, with drive letter
- Must be an NTFS file system
- Drive must have > 1GB of free space
- VSS Must be disabled

Note: Windows Trim does not work with Windows 8 and RST version 9.5 or earlier. Optimizer is available for user to employ trim capability on this configuration.

Note: 2. The Intel SSD Optimizer can be used on a drive in a RAID array if **all** of the following conditions are true:

- The drives are configured as RAID0
 - SAS_RAID_TYPE_0 required for Windows 10
- Version 11.0 or later of Intel® Rapid Storage Technology (RST) is installed
- All drives in the RAID array are Intel SSDs that support Trim
- The array is healthy
- Only Windows 10 and Windows Server 2012 and 2016 are supported
- Cannot run on a 'member' of a RAID volume, only the volume as a whole

Related Sections

[Manually Running the Intel SSD Optimizer](#)

[Scheduling the Intel SSD Optimizer](#)

4.3 Manually Running the Intel® SSD Optimizer

Note the following before manually running the Intel SSD Optimizer:

- Do not run the Intel SSD Optimizer when a backup is in progress.
- Do not run the Intel SSD Optimizer if the Intel SSDs are in a RAID configuration.³
- The Intel SSD Optimizer does not support Windows 8, Windows 8.1, Windows 10 or Windows Server 2012 Storage Spaces, nor any individual drive that is a member of a Storage Space.

To run the Intel SSD Optimizer:

1. Select the Intel SSD on the home navigation bar.
2. Select **Intel SSD Optimizer** under the Features dropdown menu.
3. Click **Run**.
4. Review the text describing the Intel SSD Optimizer requirements, and then click **Start**.

If you receive a warning message stating the Intel SSD Optimizer has detected the presence of either RAID or encryption on the selected Intel SSD, review the following:

- If the Intel SSD is not in a RAID configuration but is encrypted, click Accept to continue running the Intel SSD Optimizer on the selected SSD. See [Troubleshooting - Intel SSD Optimizer](#) for more information.
- If the Intel SSD is in a RAID configuration, click Decline to stop running the Intel SSD Optimizer. The Intel SSD Optimizer cannot run on Intel SSDs in a RAID configuration.³ See [Troubleshooting - Intel SSD Optimizer](#) for more information.

The Intel SSD Optimizer starts. A progress bar shows the status of the tool.

- Note:**
3. Intel SSD Optimizer can be used on a drive in a RAID array if all of the following conditions are true:
 - The drives are configured as RAID 0
 - Version 11.0 or later of Intel® Rapid Storage Technology (RST) is installed
 - All drives in the RAID array are Intel SSDs that support Trim
 - The array is healthy
 - Only Windows 10 and Windows Server 2012 and 2016 are supported
 - Cannot run on a 'member' of a RAID volume, only the volume as a whole

[Intel SSD Optimizer Requirements](#)

[Scheduling the Intel SSD Optimizer](#)

4.4 Scheduling the Intel® SSD Optimizer

Note the following before setting a schedule:

- Make sure Intel SSD Optimizer sessions are scheduled to run when the computer is on. The Intel SSD Optimizer does not wake up or turn on the computer to run a scheduled session.
- Do not schedule the Intel SSD Optimizer to run when a backup is in session.
- Do not run the Intel SSD Optimizer if the Intel SSDs are in a RAID configuration.⁴

To schedule the Intel SSD Optimizer:

1. [Manually run](#) the Intel SSD Optimizer one time to verify it runs successfully. Once the manual run is successful, you can set an automated scheduled operation.
2. On the drive selection navigation bar, select the Intel SSD you want to schedule with the Intel SSD Optimizer.
3. Select **Intel SSD Optimizer** from the Features dropdown.
4. Click **Schedule**
If your computer contains more than one Intel SSD, you can apply the schedule to all supported Intel SSDs by clicking **All Supported Intel SSDs**.
5. Set the schedule (including day, time, and frequency).
6. Click Add.
7. Review the requirement text and click Schedule.

The schedule appears on the screen.

If you receive a warning message stating the Intel SSD Optimizer has detected the presence of either RAID or encryption on the selected Intel SSD, review the following:

- If the Intel SSD is not in a RAID configuration but is encrypted, click **Accept** to continue running the Intel SSD Optimizer on the selected SSD. See [Troubleshooting - Intel SSD Optimizer](#) for more information.
- If the Intel SSD is in an unsupported RAID configuration⁴, click **Decline** to stop running the Intel SSD Optimizer. The Intel SSD Optimizer cannot run on Intel SSDs in a RAID configuration. See [Troubleshooting - Intel SSD Optimizer](#) for more information.

8. Exit the Intel SSD Optimizer or return to the home screen.

The Intel SSD Optimizer runs at the scheduled time. When the session starts, an icon appears in the Windows task tray notifying you the Intel SSD Optimizer is running. Upon completion, the icon disappears.

- Note:**
4. The Intel SSD Optimizer can be used on a drive in a RAID array if all of the following conditions are true:
 - The drives are configured as RAID0
 - Version 11.0 or later of Intel® Rapid Storage Technology (RST) is installed
 - All drives in the RAID array are Intel SSDs that support Trim
 - The array is healthy
 - Only Windows 10 and Windows Server 2012 and 2016 are supported
 - Cannot run on a 'member' of a RAID volume, only the volume as a whole

5 Running Diagnostic Scans

5.1 Quick Diagnostic Scan

Run the Quick Diagnostic scan to test the basic functionality of the selected Intel SSD. The scan takes approximately three minutes to complete and performs two tests:

- Read Scan - checks 1.5 GB of the Intel SSD for READ errors.
- Data Integrity Scan - creates 1 GB of random data, writes the data to unused areas of the Intel SSD, and then compares it for data integrity (**Note:** *The Data Integrity Scan cannot be run on a Windows 8, Windows 8.1, Windows 10 or Windows Server 2012 Storage Space, nor on any individual SSD that is a member of a Storage Space*).

The scan requires:

- A minimum of 5 GB of free space to run.
- A partitioned area to create and validate random data.

Note: Other Intel MAS tool options (such as the home screen or SMART Details screen) may be accessed while the scan is running, but no other tests (such as Intel SSD Optimizer or Full Diagnostic Scan) may be started.

1. Click **Run**.
2. View the progress on the screen.

To stop the scan, click **Cancel**.

5.2 Full Diagnostic Scan

Run the Full Diagnostic scan to perform an overall health evaluation on the selected Intel SSD.

The scan performs two tests:

- Read Scan - checks every logical block address (LBA) for READ errors.
- Data Integrity Scan - uses free space to write random data and read it back to ensure data integrity (**Note:** *The Data Integrity Scan cannot be run on a Windows 8, Windows 8.1, Windows 10 or Windows Server 2012 Storage Space, nor on any individual SSD that is a member of a Storage Space*).

The scan can take an hour or more to complete (depending on the amount of free space on the Intel SSD). The test can run in the background.

The scan requires:

- A minimum of 5 GB of free space to run.
- A partitioned area to create and validate random data.

Note: Other Intel MAS tool options (such as the home screen or SMART Details screen) may be accessed while the scan is running, but no other tests (such as Intel SSD Optimizer or Quick Diagnostic Scan) may be started.

1. Click **Run**.
2. View the progress on the screen.

To stop the scan, click Cancel.

Note: Diagnostic scans are intentionally disabled on Intel® Optane™ SSDs when system acceleration is enabled.

6 Updating Firmware

6.1 Checking for Firmware Updates

If your Intel SSD contains an older version of firmware than the version included with this release of the Intel MAS Tool, the following icon appears next to the Firmware Update option on the home screen:

To manually check for a newer version:

1. Note the firmware version of the selected Intel SSD (on the home screen).
2. Select Firmware Update from the Features dropdown.
3. Click **Check for Updates** to open the Intel Download Center to verify if there is a new version of the tool.
4. Confirm in the Release Notes or [here](#) for the latest firmware versions available for non-OEM Products.
5. Update the firmware following the instructions in [Using Firmware Update](#).

Related Sections

[Using Firmware Update](#)

6.2 Using Firmware Update

The Firmware Update option updates the selected Intel SSD to the latest firmware available with this version of the Intel MAS Tool. To check for a newer version, click **Check for Updates** on the Firmware Update screen.

Note: The firmware update functionality is not available if ATA Security is enabled on the selected SSD—whether it is locked or unlocked. Please ensure that ATA Security (also known as HDD or SSD Password) is disabled before proceeding. See your computer's documentation for instructions.

To update the firmware on an Intel SSD:

1. Back up the Intel SSD.
Perform a complete system backup on the Intel SSD to make sure no data is lost during the firmware update process. Intel is not responsible for any data loss that might occur during or after a firmware update on an Intel SSD.
2. Close all open applications except Intel MAS Tool.
3. Select the Intel SSD you want to update through the drive selection navigation bar.
4. Select **Firmware Update** from the Features drop down.
5. Click **Update** to update the selected Intel SSD with the firmware version included with this release of Intel MAS Tool. Minimize system use during this operation.
6. Reboot your system once the update is complete.

Related Sections

7 Tuning Your System

7.1 System Tuner

Use the System Tuner to check your system and adjust settings to improve the performance, power, and endurance of the selected Intel SSD. If your system requires tuning, the following icon appears next to System Tuner on the home screen:

To run the System Tuner:

1. Select the Settings Icon  on the home screen.
2. Click **System Tuner**.

The System Tuner displays services that can be optimized for use with the selected Intel SSD. If a service is available and can be optimized, **Tune!** appears next to the service name.

Intel® Rapid Storage Technology (Intel® RST) Write Cache

For best performance, Intel recommends enabling Write Back cache in Intel® RST/Intel® Matrix Storage Manager console.

Note: This service appears on the System Tuner screen only if your system has an Intel® RST RAID volume configuration containing only Intel SSD RAID volume members.

Superfetch/Prefetch

In Microsoft Windows 8 and newer, Superfetch functions differently than in previous versions of Windows, and should not be disabled for an Intel SSD.

Device Initiated Power Management (DIPM)

For Intel SSDs installed in mobile systems, DIPM is the most efficient power management method for managing SATA link power. With DIPM, link management is handled by the SSD (the SSD knows best how long a specific command might take to complete and is best equipped to request a link power management state change while processing the command). DIPM should be enabled on Intel SSDs for optimal performance.

Defragmenter

Microsoft Windows Disk Defragmenter rearranges files stored on a disk to occupy contiguous storage locations to increase access speed and optimize the time it takes to read and write files to and from the disk. In, Windows 8* and newer, Disk Defragmenter should be disabled on Intel SSDs.

3. Click Tune! next to the setting you want to optimize.

Additionally, depending on your system configuration and operating system, perform these tasks to optimize performance:

- [Dual-drive systems \(HDD + SSD\)](#)
- [SSD-only systems](#)
- [Mobile systems with shock sensor](#)
- [Intel SSDs in RAID Configurations Using Intel® Rapid Storage Technology Driver](#)
- [Mobile systems without Intel® Rapid Storage Technology or Intel® Matrix Storage Manager](#)

Related Sections

[Changing System Tuner Settings](#)

7.2 Additional Tips for Optimizing Performance

In addition to running the System Tuner, perform these tasks (depending on your system configuration and operating system) to optimize the performance of an Intel SSD:

- [Dual-drive systems \(HDD + SSD\)](#)
- [SSD-only systems](#)
- [Mobile systems with shock sensor](#)
- [Intel SSDs in RAID Configurations](#)
- [Mobile systems without Intel Rapid Storage Technology or Intel Matrix Storage Manager](#)

Related Sections

[Running System Tuner](#)

7.2.1 Dual-Drive Systems

If you have an Intel SSD installed as part of a dual-drive configuration (SSD + hard disk drive), review these tips to help optimize performance of the Intel SSD:

- Install your most frequently used applications on the Intel SSD.
- Run and schedule Disk Defragmenter on the hard disk drive only.
- Make sure Disk Defragmenter does not run, and is not scheduled to run, on the Intel SSD.

Related Sections

[Running System Tuner](#)

7.2.2 SSD-only Systems

If you have an Intel SSD installed as the only drive in your system, make sure Disk Defragmenter does not run (and is not scheduled to run) on the Intel SSD.

Scheduled Tasks is available in the Task Scheduler (Windows 10 example). Press the Windows Key and type 'scheduler'

Related Sections

[Running System Tuner](#)

7.2.3 Mobile Systems with Shock Sensor

If you have an Intel SSD installed in a mobile system with shock sensor, make sure the shock sensor on the mobile system is disabled.

Note: Intel SSDs are not affected with performance degradation caused by shock or vibration in specified limits, and therefore, can run with the shock sensor disabled. See your system documentation for information on disabling this feature.

Related Sections

[Running System Tuner](#)

7.2.4 Intel SSDs in RAID Configurations Using Intel® Rapid Storage Technology Driver

To obtain higher performance from RAID configurations consisting of Intel SSDs and Intel® Rapid Storage Technology (Intel® RST), make sure Intel® RST Write Back Cache is enabled.

Note: Enabling Write Back Cache increases the chance of system data loss during a power-loss event. (However, all data written to the SSD will be committed to NAND during a power-loss event.) See your system documentation for information on enabling or disabling this feature.

Related Sections

[Running System Tuner](#)

7.2.5 Mobile Systems without Intel® Rapid Storage Technology or Intel® Matrix Storage Manager

To obtain higher performance on mobile systems with an Intel SSD without Intel Rapid Storage Technology, enable DIPM (Device Initiated Power Management) on your mobile system. See your system documentation for instructions.

Related Sections

[Running System Tuner](#)

7.3 Changing System Tuner Settings

System Tuner can [configure services](#) to optimize your system for use with an Intel SSD. To change a service back to its original setting once optimized, you must manually configure the service.

For complete instructions on all services, see your operating system documentation.

Changing Device Initiated Power Management (DIPM)⁵

The System Tuner enables DIPM in mobile systems.

For instructions on other operating systems, see the system documentation that came with your operating system.

Note: 5. Not applicable for NVMe drives.

§

8 Performing a Secure Erase

8.1 About Secure Erase

Secure Erase permanently deletes all data on an Intel SSD. To run Secure Erase, the Intel SSD must be installed as a secondary SSD in your system.

 **CAUTION:** Secure Erase is an unrecoverable operation that permanently deletes all data on an Intel SSD. Secure Erase eliminates not only the user data section of the SSD, but also the reserve data area, rendering data remnants virtually unrecoverable. Secure Erase is an addition to the existing *format drive* command available in computer operating systems. Once you run Secure Erase on an Intel SSD, there is no possibility to recover data from the SSD.

On Intel SSDs containing 25nm and later NAND Flash Memory, retired blocks are also erased.

- On Intel SSDs supporting encryption, the encryption key used in randomizing data is re-generated after Secure Erase
- Secure Erase is blocked by the Windows 8, Windows 8.1 and Windows 10 operating systems on SATA drives
- Secure Erase is not available if ATA Security is enabled on the selected SSD—whether it is locked or unlocked.

Related Sections

[Secure Erase Requirements](#)

[Deleting a Partition](#)

[Running Secure Erase](#)

8.2 Secure Erase Requirements

Note: Secure Erase is blocked for SATA drives by the Windows 8, Windows 8.1 and Windows 10 operating systems.

To run Secure Erase on an Intel SSD:

- Back up any data onto another drive if you want to keep any of the data on the Intel SSD.
- The SSD must be the secondary drive in the system. Secure Erase cannot be run from a bootable SSD or on an SSD with a partition.
- All drive passwords (ATA Security) must be disabled for the SSD⁸. See your computer's documentation for instructions.
 - Some systems provide the ability to password-protect their drives. If your system has password protection enabled, the Intel SSD may reject any requests from the host to update the firmware. Turn off the drive password protection prior to beginning the Firmware update process.
 - Although it varies from system to system, you can usually find the Drive Password Protection feature located in the BIOS. Consult your system documentation for the BIOS settings and passwords.
 - If you need help disabling the drive password protection feature, contact [Intel Customer Support](#).
- The system must allow access to the SATA power cable connected to the SSD.
- All partitions must be removed from the SSD.
- Back up any data onto another drive if you want to keep any of the data on the Intel SSD.

Related Sections

[Deleting a Partition](#)

[Running Secure Erase](#)

8.3 Deleting a Partition

These instructions describe how to delete a partition on an Intel SSD in Microsoft Windows in preparation for running Secure Erase on the SSD.

These steps logically delete a partition, which makes all data unavailable on the SSD. These steps can be performed while Intel MAS tool is running.

1. In Windows, right-click the Windows Key and select **Disk Management**.
2. Select the Intel SSD that contains the partition.
3. Locate the partition on the Intel SSD (indicated by a drive letter).
4. Right-click on the partition and select **Delete Partition** or **Delete Volume**.
5. Confirm the deletion, if prompted.
6. Exit the Windows Disk Management screen.
7. After deleting the partition, click **Refresh** on the Intel MAS tool home screen.

Related Sections

[Running Secure Erase](#)

8.4 Running Secure Erase

Run Secure Erase to permanently delete all data on a secondary Intel SSD installed in your system.

⚠ CAUTION: Secure Erase is an unrecoverable operation that permanently deletes all data on an Intel SSD. Secure Erase eliminates not only the user data section of the SSD, but also the reserve data area, rendering data remnants virtually unrecoverable. Secure Erase is an addition to the existing *format drive* command available in computer operating systems. Once you run Secure Erase on an Intel SSD, there is no possibility to recover data from the SSD.

1. [Review the requirements](#) before running Secure Erase.
2. [Delete all partitions](#) on the Intel SSD to be erased.
3. Select the Intel SSD on the home screen and view the Drive Summary information to verify the Intel SSD is the drive you want to erase.
4. Under the Features dropdown, select **Secure Erase**.
5. Click **Erase**.

If a Secure Frozen Warning message appears:

A Secure Frozen Warning message indicates the SSD is in the SECURITY FREEZE LOCK state. Secure Erase cannot be performed on an SSD when it is in this state. To prepare the SSD for the removal of the SECURITY FREEZE LOCK state, the Intel MAS tool sends the STANDBY IMMEDIATE command to the SSD, which results in the warning message.

To remove the SECURITY FREEZE LOCK state and continue with the Secure Erase process:

- a. Power-cycle the SSD by removing the SATA power cable from the SSD and quickly reconnecting it while the Intel MAS tool is running. Depending on your system configuration, this may require that you physically remove the SSD from the system.

Note: Intel recommends performing this process quickly to make sure the system continues to recognize the SSD.

- b. After unplugging and plugging in the SSD, click OK.

The Intel MAS tool rescans the system for the SSD. Once the SSD is detected, continue with Step 6.

If the SSD is not detected, click **OK** on the Selected Drive Not Found message. The Intel MAS tool home screen appears and scans the system for drives. Once the Intel SSD is detected, select the Intel SSD on the home screen and click **Secure Erase**.

If the Security warning message appears again, repeat the power-cycling process (steps a and b), making sure to quickly remove and reconnect the SATA power cable. If the Secure Frozen Warning message continues to appear, this indicates that power-cycling the drive is not removing the SECURITY FREEZE LOCK state on this system. If this is the case, Intel MAS tool cannot run Secure Erase on this system. Intel recommends obtaining a drive utility with Secure Erase and running Secure Erase from that utility.

If the SSD is not detected and does not appear on the home screen, open the Windows Device Manager and rescan the system for drives (right-click the Windows Key and select **Device Manager**, then right-click **Disk Drives > Scan for hardware changes**).

After scanning the system, click **Refresh** on the Intel MAS tool home screen and try the Secure Erase procedure again, making sure to quickly remove and reconnect the SATA power cable.

6. Click **Run**.

Secure Erase starts on the selected Intel SSD. A progress bar shows the status of the operation. The process can take 1 to 2 minutes, depending on the capacity of the SSD.

 **CAUTION:** Your system may appear to stop responding during this operation. Do not power off or disconnect power from your system during the operation, as this can damage the SSD.

7. When complete, [create an active partition and format the SSD](#).
8. Click **Refresh** on the home screen to view the Intel SSD.

Related Sections

[Creating a Partition](#)

8.5 Creating a Partition

These instructions describe how to create and format a partition on an Intel SSD in Microsoft Windows 7. These instructions can be helpful for preparing an SSD after performing a Secure Erase. For more information or instructions for other operating systems, see the documentation for your operating system.

1. Right-click the Windows Key and select **Disk Management**.
2. Select the Intel SSD on which you want to create a partition and click **New Simple Volume**.
3. Click **Next** when the New Simple Volume Wizard starts.
4. Enter the information for the partition (size of partition, drive letter).
5. Click **Next**.
6. Select an option to format the partition, and then click **Next**.
7. Click **Finish**.

9 LED Color Feature – Intel® Optane™ SSD 905P Series Only

9.1 Intel® Optane™ SSD 905P LED Color

This section describes how to check the change the LED color on Intel® Optane™ Solid State Drive 905P Series.

1. Select the intel SSD you want to change the LED color of.
2. Select the LED Color feature.
3. Select the color desired.

§

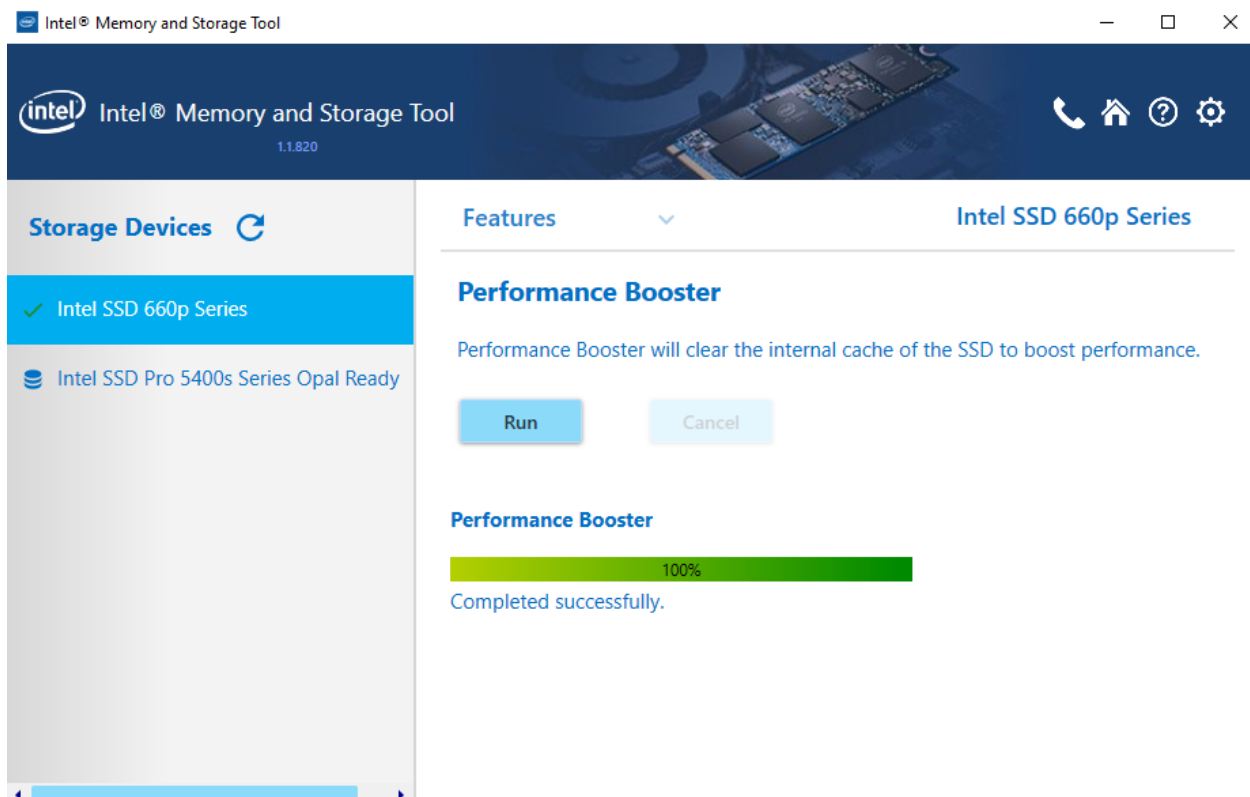

10 Performance Booster Feature

10.1 Intel® Solid State QLC and Hybrid Drive

Intel® SSD QLC QLC-based SSDs, such as 660p series/ Intel® Optane™ Memory H10 with Solid State Storage, are equipped with a cache architecture to boost performance. This feature will move and clear the contents of the available cache and boost the performance of the SSD. The following section describes how to run performance boost feature.

Select the device connected to your system

1. Select the Performance Booster feature under the Features dropdown menu.
2. Click the “Run” button.
3. If user decides to cancel, the progress bar will show the percentage of cache that’s been cleared. For example, refer to the image below.
4. Once the entire cache is clear the progress bar should show 100 percent. Refer to the image below.

11 Intel® Optane™ Memory H10 with Solid State Storage

11.1 Intel® Optane™ Memory H10 with Solid State Storage

This section describes use of Intel MAS tool for Intel® Optane™ Memory H10 with Solid State Storage. This is Intel's first client Intel® Optane™ memory – NAND Flash Hybrid SSD. This first generation hybrid combines technologies of Intel® Optane™ memory and Intel NAND Flash technologies into a single M.2 2280-S3-M form factor. As such, the single M.2 device will initially enumerate as two distinct drives in the operating system. However, once enabled, the Intel® Optane™ memory accelerated volume will be shown as a single device.

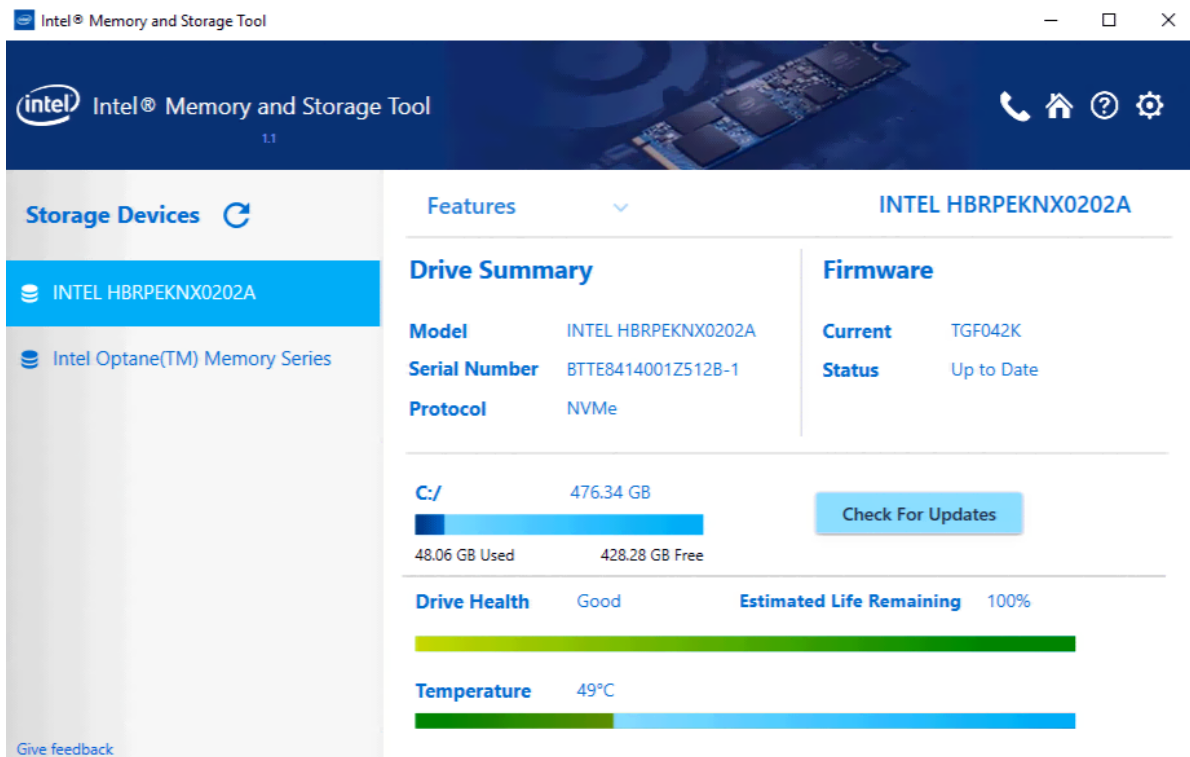

NOTES:

- To enable acceleration with Intel Optane Memory please refer to the [Intel Optane Memory Installation Guide](#)
- If the Intel Rapid Storage Technology (Intel RST) driver is not installed, only the NAND portion of the drive will be enumerated (see bullet A below)

Intel MAS tool intended usage for Intel® Optane™ Memory H10 is only when the device is connected to Intel® Optane™ Memory H10 supported platform. Intel MAS tool not supported for Intel® Optane™ Memory H10 on unsupported platform.

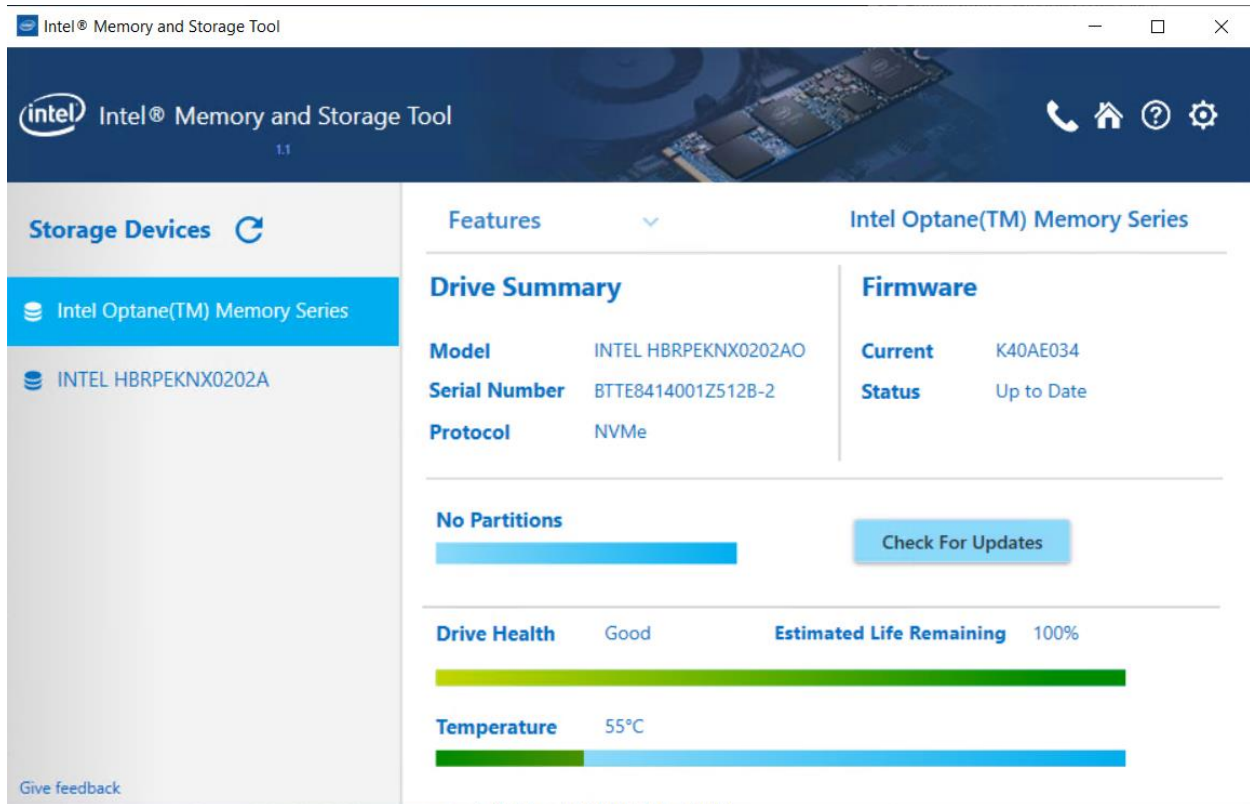

The two use cases when the device is plugged into Intel® Optane™ Memory H10 supported platform

A. Default, no Intel RST driver installed. Refer to the image below.

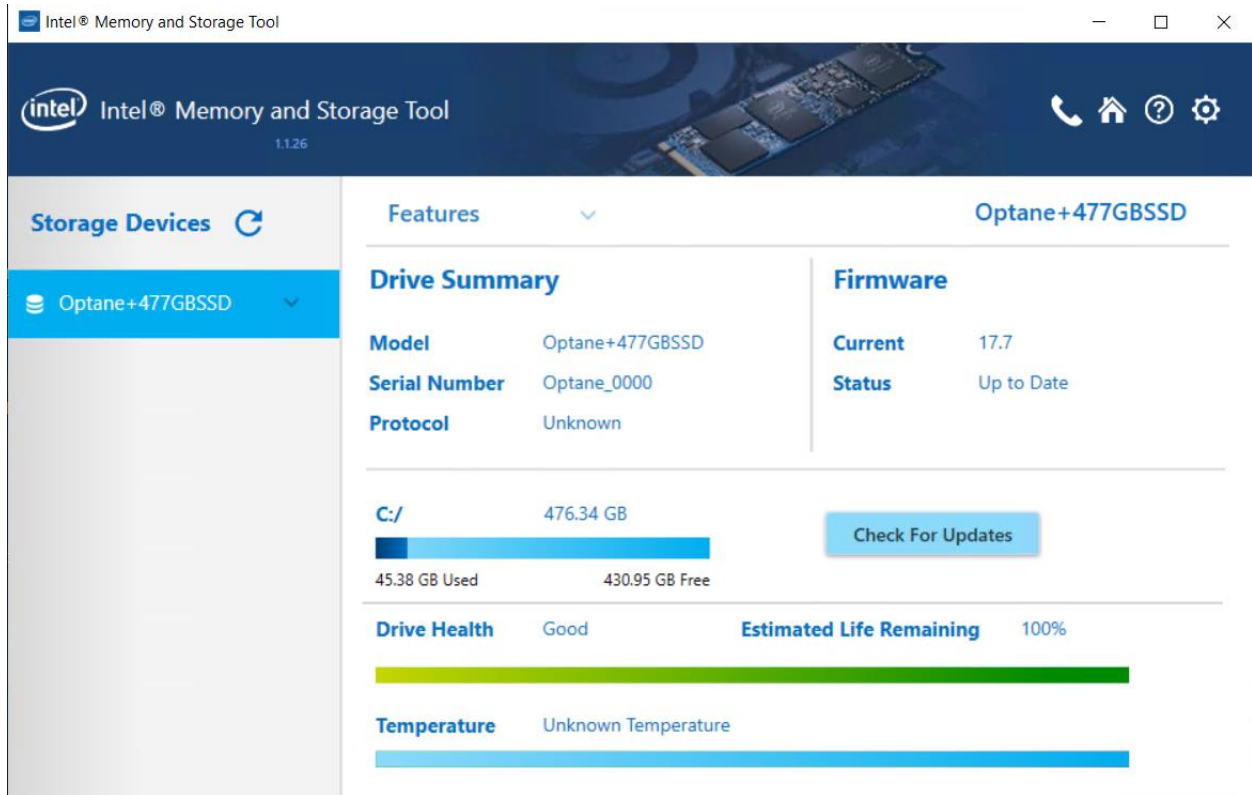

B. With Intel RST driver installed, but with Intel® Optane™ memory disabled. Refer to the image below.

- C. With Intel® Optane™ memory enabled, see both Intel® Optane™ memory and Intel NAND Flash. Click on each tab for details.

The screenshot shows the Intel Memory and Storage Tool interface. The window title is "Intel® Memory and Storage Tool" with version "1.1.26". The main header includes the Intel logo and navigation icons. A sidebar on the left lists "Storage Devices" with "Optane+477GBSSD" selected. The main content area displays details for the selected drive:

- Features:** Optane+477GBSSD
- Drive Summary:**
 - Model: Optane+477GBSSD
 - Serial Number: Optane_0000
 - Protocol: Unknown
- Firmware:**
 - Current: 17.7
 - Status: Up to Date
- Storage Usage:** C:/ drive with 476.34 GB total capacity. A progress bar shows 45.39 GB Used and 430.95 GB Free. A "Check For Updates" button is present.
- Drive Health:** Good. **Estimated Life Remaining:** 100% (represented by a full green bar).
- Temperature:** Unknown Temperature (represented by a blue bar).

12 Troubleshooting

12.1 Troubleshooting - Drives

Drive does not appear on the home screen

If a drive installed in the system does not appear on the home screen:

- Check power to the drive.
- For SATA drives, check the SATA cable connection and make sure the cable is properly connected to the drive and the host system.
- For NVMe drives, check that the drive is properly socketed in the CPU direct attached PCIe slot.
- Click **Refresh**  on the home screen.
- Reboot the system and restart the Intel MAS Tool.

If the problem persists, contact Intel.

SMART information does not appear for a selected drive

If the SMART Details option is not available for a selected drive, make sure SMART is enabled on the drive.

Drive Health or Estimated Life Remaining does not appear for a selected drive

Drive Health and Estimated Life Remaining information appears for Intel SSDs only with SMART enabled.

12.2 Troubleshooting - Firmware Update

If you encounter an issue updating the firmware on an Intel SSD or if the firmware update fails, use the Intel® Solid State Drive Firmware Update Tool located at:

<http://www.intel.com/go/ssdfirmware>

NOTES:

- Firmware update for the Intel® SSD 750 Series on Windows 7 and 8.1 requires the NVMe Drivers for Intel® SSDs. For Windows 10, the Microsoft Native NVMe driver may be used.
- The Firmware Update option in the Intel MAS tool can be used to update the firmware on Intel SSDs only. All Intel SSDs are supported except:
 - Intel® X25-E Solid State Drive
 - Intel® Solid State Drive 510 Series

For these SSDs, use the Firmware Update Tool mentioned above.

12.3 Troubleshooting - Intel® SSD Optimizer

Tool is not supported on the selected drive

This error message may appear when trying to run the Intel SSD Optimizer if the selected Intel SSD does not have the latest firmware installed or if the SSD lithography is 50nm (G1).

1. [Check the lithography](#) of the Intel SSD to make sure it is supported by the Intel SSD Optimizer.
2. [Check the firmware](#) to make sure the Intel SSD is using the latest version.

Cannot run the Intel SSD Optimizer on RAID configurations

The Intel SSD Optimizer cannot run on Intel SSDs in RAID configurations, except when *ALL* the following conditions are true:

- The drives are configured as RAID0
- Version 11.0 or later of Intel® Rapid Storage Technology (RST) is installed
- All drives in the RAID array are Intel SSDs that support Trim
- The array is healthy
- Only Windows 10 and Windows Server 2012 and 2016 are supported
- Cannot run on a 'member' of a RAID volume, only the volume as a whole

The Intel MAS tool checks for RAID configurations at startup. However, because not all RAID configurations can be detected at startup, the tool runs a second check when starting the Intel SSD Optimizer. If the selected Intel SSD is in an unsupported RAID configuration, the tool displays the “**Cannot run the Intel SSD Optimizer on RAID configurations**” error message.

If the second check does not detect a RAID configuration, the SSD may still be part of a RAID configuration or the SSD may be using an encryption scheme. In this case, the Intel MAS tool displays a warning screen and prompts you to identify whether the SSD is part of a RAID configuration or is encrypted.

- If the SSD is encrypted and is not in a RAID configuration, click **Accept** to run the Intel SSD Optimizer on the selected SSD.
- If the SSD is in an unsupported RAID configuration, click **Decline** to stop the Intel SSD Optimizer.

§
